

HP DSS Authentication Methods

HP's Digital Sending Software can be configured to authenticate against Windows NT domain or LDAP directly. The available binding methods are anonymous, simple, SSL, NTLM, and Windows Negotiated. Credentials can be provided by the user at the MFP touch panel. DSS can configure the MFPs to require login for any individual task or users can be required to login at walk up. This would force them to login to the device to perform any task. All of the necessary configurations can be performed from DSS and copied over to multiple devices.
